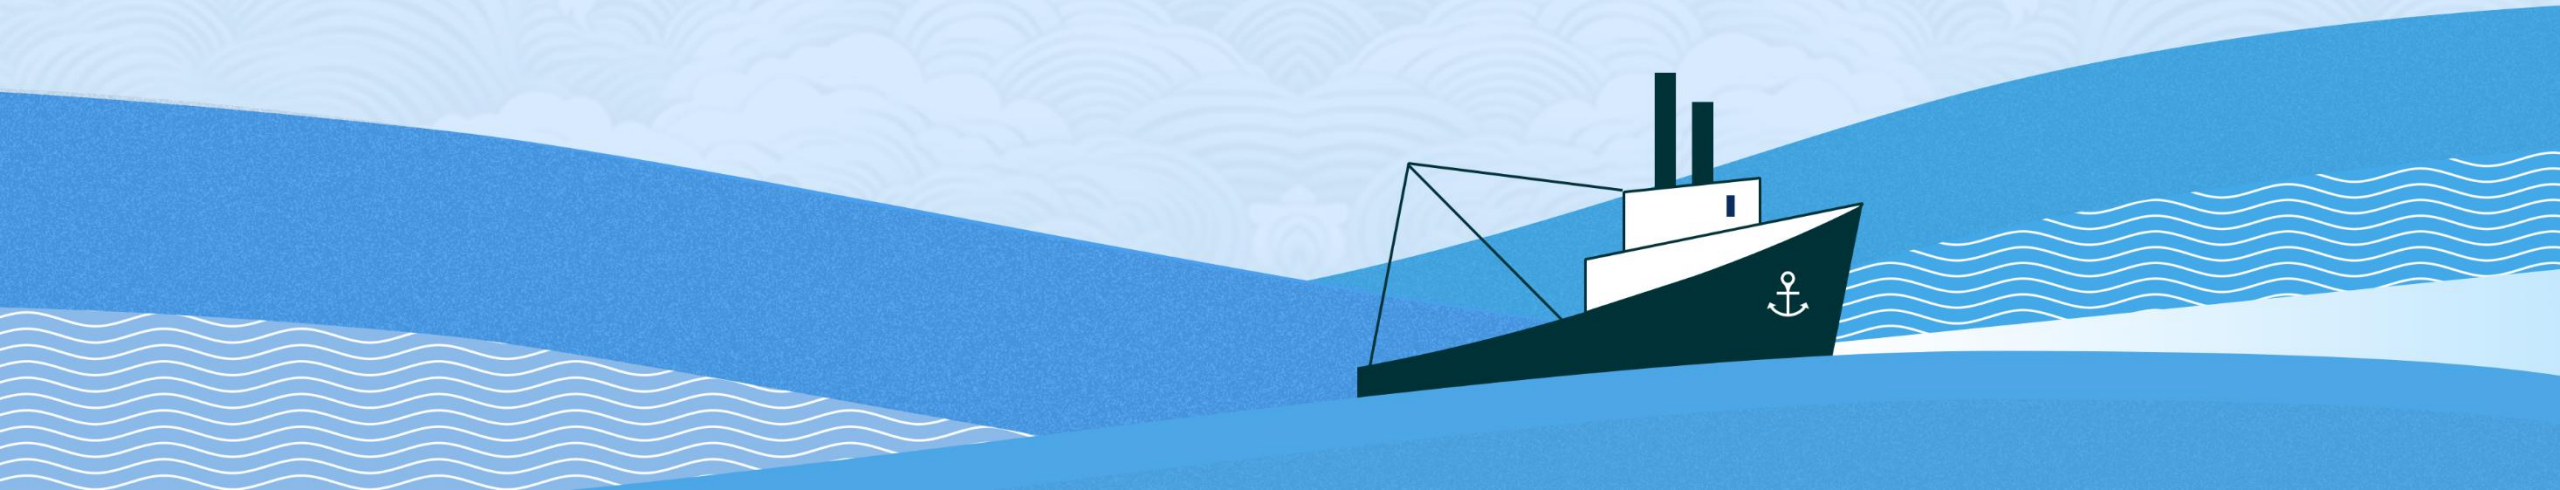
Thanks.



Example user cases to showcase

KUBERNETES COMMUNITY DAYS BEIJING

- Flexible resource management: capable of implementing all types of "CPU binding" scenarios;
- Hook injection for container runtime: capable of using OCI-Hooks capability in ContainerD to implement CRI-O functionality
- Convenient logging and debugging: With NRI, a subset of container attributes is easy to see and can be introspective
- Safety introspection and execution
- Implement and verify runtime extensions, such as when the container is running, and want to make some changes to support confidential computing
